Dear Parent or Parent-to-Be,

This booklet contains helpful information on vaccines for you and your family.

Vaccines save lives. They protect against serious diseases like COVID-19, measles, flu, whooping cough, and chickenpox. Vaccinating children against certain diseases is one important way to help them stay healthy.

WIC is dedicated to partnering with other services to support your family's whole health, including by promoting immunizations. WIC staff can help you keep your child up-to-date on their vaccines -- all you need to do is either track your child's electronic vaccination records in your state's immunization information system (IIS) or keep a paper copy. If your child is behind on vaccinations, WIC staff will suggest a place you can go to get your child the vaccines they need.

Most health insurance plans cover the cost of vaccines, but you may want to check with your insurance provider before going to the doctor. If your child does not have health insurance, is Medicaid-eligible, or is under-insured, they may be able to receive free vaccines at their doctor’s office or a health center through the federal Vaccines for Children program (VFC). For more information on VFC and how to pay for your family’s vaccines, visit vaccinateyourfamily.org/vfc.

Adults, especially pregnant people, need vaccines too. By getting yourself vaccinated while pregnant you are helping to protect BOTH you and your baby from serious diseases such as flu, whooping cough, and COVID-19. For more information and for answers to questions you may have about vaccines for your family, please visit vaccinateyourfamily.org.

This booklet was created by Vaccinate Your Family and is supported through funding provided by The Centers for Disease Control and Prevention.
# 2023 Recommended Immunizations for Children from Birth Through 6 Years Old

## FOOTNOTES

- **RV***: Administering a third dose at age 6 months depends on the brand of Hib or rotavirus vaccine used for previous dose.
- **Hib***: Two doses given at least 4 weeks apart are recommended for children age 6 months through 8 years of age who are at risk for infection (flu) vaccine for the first time and for some other children in this age group.
- **COVID-19**: Number of doses recommended depends on your child's age and type of COVID-19 vaccine used.
- **Flu†**: Two doses given at least 4 weeks apart are recommended for children age 6 months through 8 years of age who are getting an influenza (flu) vaccine for the first time and for some other children in this age group.
- **HepA‡**: Two doses of Hep A vaccine are needed for lasting protection. The 2 doses should be given between age 12 and 23 months. Both doses should be separated by at least 6 months. Children 2 years and older who have not received 2 doses of Hep A should complete the series.

## ADDITIONAL INFORMATION

1. If your child misses a shot recommended for their age, talk to your child’s doctor as soon as possible to see whether it can be given.
2. If your child has any medical conditions that put them at risk for infection (e.g., sickle cell, HIV infection, cochlear implants) or is traveling outside the United States, talk to your child’s doctor about additional vaccines that they may need.

Talk with your child’s doctor if you have questions about any shot recommended for your child.

1. The second dose of HepB may be given either at the 1 month or 2 month visit.
2. A third dose of rotavirus vaccine is only needed for RotaTeq.
3. Two doses given at least four weeks apart are recommended for children aged 6 months through 8 years of age who are getting a flu vaccine for the first time and for some other children in this age group.

#### Milestones

Milestones should be achieved by the age indicated. Talk to your child’s doctor about age-appropriate milestones if your child was born prematurely.

1. Recognizes caregiver’s voice
2. Turns head toward breast or bottle
3. Communicates through body language, fussing or crying, alert and engaged
4. Starts to loud sounds
5. Starts to smile
6. Raises head when on tummy
7. Calms down when rocked, cradled or sung to
8. Pays attention to faces
9. Begins to smile at people
10. Coos, makes gurgling sounds
11. Begins to follow things with eyes
12. Can hold head up
13. Babbles with expression
14. Likes to play with people
15. Reaches for toy with one hand
16. Brings hands to mouth
17. Responds to affection
18. Holds head steady, unsupported
19. Knows familiar faces
20. Responds to own name
21. Brings things to mouth
22. Rolls over in both directions

#### Growth

At each well child visit, enter date, length, weight, and percentile information to keep track of your child’s progress.

<table>

### Recommended Immunizations

- **Hepatitis B**
  - HepB (Final dose administered between 6 and 18 months)

- **Diphtheria, Tetanus, Pertussis**
  - DTaP

- **Haemophilus influenzae type b**
  - Hib

- **Pneumococcal**
  - PCV

- **Inactivated Poliovirus**
  - IPV (Third dose administered between 6 and 18 months)

- **Influenza (Flu)**
  - Influenza, first dose
  - Second dose (if needed)

- **Measles, Mumps, Rubella**
  - MMR

- **Varicella**
  - Varicella

- **Hepatitis A**
  - Hep A

### Milestones

#### Milestones should be achieved by the age indicated.

**Talk to your child's doctor about age-appropriate milestones if your child was born prematurely.**

- Grows when mom or dad leaves
- Says "mama" and "dada"
- Copies gestures (for example, waves "bye bye")
- May stand alone
- Looks at right picture or thing when named

- Imitates what you are doing
- Drinks from a cup
- Scribbles on his own
- Walks well
- Says a couple of words other than "mama" and "dada"

- Points to show others something interesting
- Says several single words
- Points to one body part
- May walk up steps and run

- Plays mainly beside other children
- Follows two-step commands
- Plays simple make-believe games
- Throws ball overhand

- Can name most familiar things
- Shows affection for friends without prompting
- Turns book pages one at a time
- Kicks a ball

- Speaks very clearly
- Tells stories
- Can print some letters or numbers
- Hops; may be able to skip
- Enjoys playing with other children

### Growth

At each well child visit, enter date, length, weight, and percentile information to keep track of your child's progress.

Shaded boxes indicate the vaccine can be given during shown age range.

---

* Two doses given at least four weeks apart are recommended for children aged 6 months through 8 years of age who are getting a flu vaccine for the first time and for some other children in this age group.

* Two doses of HepA vaccine are needed for lasting protection. The first dose of HepA vaccine should be given between 12 months and 23 months of age. The second dose should be given 6 months after the first dose. HepA vaccination may be given to any child 12 months and older to protect against HepA. Children and adolescents who did not receive the HepA vaccine and are at high-risk should be vaccinated against HepA.

* Milestones adapted from AAP Bright Futures: Guidelines for Health Supervision of Infants, Children, and Adolescents Third Edition. This is not an exhaustive list of milestones from 0-6 years. See more at www.cdc.gov/Milestones and download the Milestone Tracker App at www.cdc.gov/MilestoneTracker

If your child has any medical conditions that put him at risk for infections or is traveling outside the United States, talk to your child's doctor about additional vaccines that he may need.

**ONLY IN PLACES WHERE DENGUE IS COMMON** — **MUST** have a laboratory test confirming past dengue infection

| Dengue | ✔️ | ✔️ | ✔️ | ✔️ | ✔️ | ✔️ | ✔️ | ✔️ | ✔️ | ✔️ | ✔️ | ✔️ |

**FOOTNOTES**

- **COVID-19**<sup>☆</sup>: Number of doses recommended depends on your child's age and type of COVID-19 vaccine used.
- **Flu**<sup>**</sup>: Two doses given at least 4 weeks apart are recommended for children age 6 months through 8 years of age who are getting an influenza (flu) vaccine for the first time and for some other children in this age group.
- **HPV**<sup>†</sup>: Ages 11 through 12 years old should get a 2-shot series separated by 6 to 12 months. The series can begin at 9 years old. A 3-shot series is recommended for those with weakened immune systems and those who start the series after their 15th birthday.

*Originally recommended age ranges for missed childhood vaccinations: 2-dose series of MMR at 12–15 months and 4–6 years; 2-dose series of Varicella at 12–15 months and 4–6 years; 2-dose series of HepA (minimum interval: 6 months) at age 12–23 months; 3-dose series of HepB at birth, 1–2 months, and 6–18 months; and 4-dose series of Polio at 2 months, 4 months, 6–18 months, and 4–6 years.

---

**KEY**

- Indicates when the vaccine is recommended for all children unless your doctor tells you that your child cannot safely receive the vaccine.
- Indicates the vaccine series can begin at this age.
- Indicates the vaccine should be given if a child is catching up on missed vaccines. A vaccine series does not need to be restarted, regardless of the time that has elapsed between doses.
- Indicates children not at increased risk may get the vaccine if they wish after speaking to a provider.

**ADDITIONAL INFORMATION**

1. If your child misses a shot recommended for their age, talk to your child's doctor as soon as possible to see when the missed shot can be given.
2. If your child has any medical conditions that put them at risk for infection or is traveling outside the United States, talk to your child's doctor about additional vaccines that they may need.

Talk with your child's doctor if you have questions about any shot recommended for your child.

---

**FOR MORE INFORMATION**

Call toll-free: 1-800-CDC-INFO (1-800-232-4636)
Or visit: cdc.gov/vaccines/parents
COVID-19 IMPACTS KIDS, TOO!

Nearly **200,000 children** have been hospitalized with COVID-19

While most children with COVID-19 have mild symptoms or no symptoms at all, children can – and some do – get severely ill from COVID. Those that get very sick from COVID could need to be hospitalized.

In rare cases, they might die.

**COVID-19 VACCINES ARE THE BEST PROTECTION AGAINST THE VIRUS THAT CAUSES COVID.**

Vaccines are now recommended for babies and children 6 months and older. The vaccine provides protection against severe disease, hospitalization, and death.

To see if your children are up to date on their vaccines, look at the CDC’s immunization schedule and talk to your healthcare provider.
Infant Immunizations FAQs

It's natural you have questions about your child's vaccines. Read answers to common questions to learn more about vaccine safety, the recommended schedule, how vaccines protect your child from 14 diseases by age two, and more. CDC regularly updates this document to ensure frequently asked questions from parents are answered with the most current information.

Q: Are vaccines safe?
A: Yes. Vaccines are very safe. The United States' long-standing vaccine safety system ensures that vaccines are as safe as possible. Currently, the United States has the safest vaccine supply in its history. Millions of children safely receive vaccines each year. The most common side effects are typically very mild, such as pain or swelling at the injection site.

Q: What are the side effects of the vaccines? How do I treat them?
A: Vaccines, like any medication, may cause some side effects. Most of these side effects are very minor, like soreness where the shot was given, fussiness, or a low-grade fever. These side effects typically only last a couple of days and are treatable. For example, you can apply a cool, wet washcloth on the sore area to ease discomfort.

Serious reactions are very rare. However, if your child experiences any reactions that concern you, call the doctor's office.

Q: What are the risks and benefits of vaccines?
A: Vaccines can prevent infectious diseases that once killed or harmed many infants, children, and adults. Without vaccines, your child is at risk for getting seriously ill and suffering pain, disability, and even death from diseases like measles and whooping cough. The main risks associated with getting vaccines are side effects, which are almost always mild (redness and swelling at the injection site) and go away within a few days. Serious side effects after vaccination, such as a severe allergic reaction, are very rare and doctors and clinic staff are trained to deal with them. The disease-prevention benefits of getting vaccines are much greater than the possible side effects for almost all children. The only exceptions to this are cases in which a child has a serious chronic medical condition like cancer or a disease that weakens the immune system, or has had a severe allergic reaction to a previous vaccine dose.

Q: Is there a link between vaccines and autism?
A: No. Scientific studies and reviews continue to show no relationship between vaccines and autism.

Some people have suggested that thimerosal (a compound that contains mercury) in vaccines given to infants and young children might be a cause of autism. Others have suggested that the MMR (measles-mumps-rubella) vaccine may be linked to autism. However, numerous scientists and researchers have studied and continue to study the MMR vaccine and thimerosal, and they reach the same conclusion: there is no link between MMR vaccine or thimerosal and autism.

Q: Can vaccines overload my baby’s immune system?
A: Vaccines do not overload the immune system. Every day, a healthy baby’s immune system successfully fights off thousands of germs. Antigens are parts of germs that cause the body’s immune system to go to work to build antibodies, which fight off diseases. The antigens in vaccines come from the germs themselves, but the germs are weakened or killed so they cannot cause serious illness. Even if babies receive several vaccinations in one day, vaccines contain only a tiny fraction of the antigens they encounter every day in their environment. Vaccines give your child the antibodies they need to fight off serious vaccine-preventable diseases.

Q: Why are so many doses needed for each vaccine?
A: Getting every recommended dose of each vaccine provides your child with the best protection possible. Depending on the vaccine, your child will need more than one dose to build high enough immunity to prevent disease or to boost immunity that fades over time. Your child may also receive more than one dose to make sure they are protected if they did not get immunity from a first dose, or to protect them against germs that change over time, like flu. Every dose is important because each protects against infectious diseases that can be especially serious for infants and very young children.

Q: Why do vaccines start so early?
A: The recommended schedule protects infants and children by providing immunity early in life, before they come into contact with life-threatening diseases. Children receive immunization early because they are susceptible to diseases at a young age. The consequences of these diseases can be very serious, even life-threatening, for infants and young children.

Q: What do you think of delaying some vaccines or following a non-standard schedule?
A: Children do not receive any known benefits from following schedules that delay vaccines. Infants and young children who follow immunization schedules that spread out or leave out shots are at risk of developing diseases during the time they delay their shots. Some vaccine-preventable diseases remain common in the United States and children may be exposed to these diseases during the time they are not protected by vaccines, placing them at risk for a serious case of the disease that might cause hospitalization or death.

CDC recommends all children receive vaccines according to the recommended immunization schedule to protect them from 14 diseases by age two. Read below to get answers to 19 common questions about how vaccines benefit your child, the vaccine schedule, and more.
Infant Immunizations FAQs

Q: Haven't we gotten rid of most of these diseases in this country?
A: Some vaccine-preventable diseases, like pertussis (whooping cough) and chickenpox, remain common in the United States. On the other hand, other diseases vaccines prevent are no longer common in this country because of vaccines. However, if we stopped vaccinating, the few cases we have in the United States could very quickly become tens or hundreds of thousands of cases. Even though many serious vaccine-preventable diseases are uncommon in the United States, some are common in other parts of the world. Even if your family does not travel internationally, you could come into contact with international travelers anywhere in your community. Children who don't receive all vaccinations and are exposed to a disease can become seriously sick and spread it through a community.

Q: What are combination vaccines? Why are they used?
A: Combination vaccines protect your child against more than one disease with a single shot. They reduce the number of shots and office visits your child would need, which not only saves you time and money, but also is easier on your child. Some common combination vaccines are Pediarix®, which combines DTap, Hep B, and IPV (polio), and ProQuad®, which combines MMR and varicella (chickenpox).

Q: Can't I just wait until my child goes to school to catch up on immunizations?
A: Before entering school, young children can be exposed to vaccine-preventable diseases from parents and other adults, brothers and sisters, on a plane, at child care, or even at the grocery store. Children under age 5 are especially susceptible to diseases because their immune systems have not built up the necessary defenses to fight infection. Don’t wait to protect your baby and risk getting these diseases when he or she needs protection now.

Q: Why does my child need a chickenpox shot? Isn’t it a mild disease?
A: Your child needs a chickenpox vaccine because chickenpox can actually be a serious disease. In many cases, children experience a mild case of chickenpox, but other children may have blisters that become infected. Others may develop pneumonia. There is no way to tell in advance how severe your child's symptoms will be.

Q: My child is sick right now. Is it okay for her to still get shots?
A: Talk with your child's doctor, but children can usually get vaccinated even if they have a mild illness like a cold, earache, mild fever, or diarrhea. If the doctor says it is okay, your child can still get vaccinated.

Q: What are the ingredients in vaccines and what do they do?
A: Vaccines contain ingredients that cause the body to develop immunity. Vaccines also contain very small amounts of other ingredients. All ingredients play necessary roles either in making the vaccine, or in ensuring that the final product is safe and effective.

Q: Don't infants have natural immunity? Isn't natural immunity better than the kind from vaccines?
A: Babies may get some temporary immunity (protection) from mom during the last few weeks of pregnancy, but only for diseases to which mom is immune. Breastfeeding may also protect your baby temporarily from minor infections, like colds. These antibodies do not last long, leaving your baby vulnerable to disease.

Natural immunity occurs when your child is exposed to a disease and becomes infected. It is true that natural immunity usually results in better immunity than vaccination, but the risks are much greater. A natural chickenpox infection may result in pneumonia, whereas the vaccine might only cause a sore arm for a couple of days.

Q: Can't I just wait to vaccinate my baby, since he isn't in child care, where he could be exposed to diseases?
A: No, even young children who are cared for at home can be exposed to vaccine preventable diseases, so it's important for them to get all their vaccines at the recommended ages. Children can catch these illnesses from any number of people or places, including from parents, brothers or sisters, visitors to their home, on playgrounds or even at the grocery store. Regardless of whether or not your baby is cared for outside the home, she comes in contact with people throughout the day, some of whom may be sick but not know it yet. If someone has a vaccine preventable disease, they may not have symptoms or the symptoms may be mild, and they can end up spreading disease to babies or young children. Remember, many of these diseases can be especially dangerous to young children so it is safest to vaccinate your child at the recommended ages to protect her, whether or not she is in child care.

Q: Do I have to vaccinate my baby on schedule if I'm breastfeeding him?
A: Yes, even breastfed babies need to be protected with vaccines at the recommended ages. The immune system is not fully developed at birth, which puts newborns at greater risk for infections. Breast milk provides important protection from some infections as your baby's immune system is developing. For example, babies who are breastfed have a lower risk of ear infections, respiratory tract infections, and diarrhea. However, breast milk does not protect children against all diseases. Even in breastfed infants, vaccines are the most effective way to prevent many diseases. Your baby needs the long-term protection that can only come from making sure he receives all his vaccines according to the CDC's recommended schedule.

Q: What's wrong with delaying some of my baby's vaccines if I'm planning to get them all eventually?
A: Young children have the highest risk of having a serious case of disease that could cause hospitalization or death. Delaying or spreading out vaccine doses leaves your child unprotected during the time when they need vaccine protection the most. For example, diseases such as Hib or pneumococcus almost always occur in the first 2 years of a baby's life. And some diseases, like Hepatitis B and whooping cough (pertussis), are more serious when babies get them at a younger age. Vaccinating your child according to the CDC’s recommended immunization schedule means you can help protect him at a young age.

Q: I got the whooping cough and flu vaccines during my pregnancy. Why does my baby need these vaccines too?
A: The protection (antibodies) you passed to your baby before birth will give him some early protection against whooping cough and flu. However, these antibodies will only give him short-term protection. It is very important for your baby to get vaccines on time so he can start building his own protection against these serious diseases.
For the best protection from COVID-19, pregnant, recently-pregnant & breastfeeding people should get the COVID-19 vaccine ASAP!

**VACCINES DURING PREGNANCY**

Getting vaccinated while pregnant protects both you AND your baby

---

**Flu can pose serious health risks for pregnant people and newborns.**

Getting the flu shot during pregnancy is a simple way to help protect yourself and your baby from the flu.

**Flu shots are safe for you and your baby during any trimester of your pregnancy.**

**Whooping cough can be lethal for infants.**

Vaccinating during pregnancy gives your baby antibodies that protect them until they can get their vaccine at 2 months.

**Protect yourself and your baby by getting whooping cough vaccines during the 3rd trimester of every pregnancy!**

**For the best protection from COVID-19, pregnant, recently-pregnant & breastfeeding people should get the COVID-19 vaccine ASAP!**

**Pregnant and recently-pregnant people are at higher risk of serious COVID-19 illness than those who are not pregnant.**

Getting sick with COVID-19 during pregnancy may also put your baby at increased risk of stillbirth and preterm birth.

---

**Surround Your Baby with Protection**

Ask friends, family and caregivers who plan to visit your baby to be up-to-date on all of their vaccinations at least two weeks before meeting your newborn.

Keeping Track of Your Child’s Vaccines: Q & A for Parents

What are Immunization Information Systems?
Immunization Information Systems (IIS), also known as immunization registries, are electronic systems that have information on the vaccines that were given to your child. Each state has its own IIS. **There is NO cost for having records in IIS.**

What are the benefits of having my child’s vaccine record saved in an IIS?
- Helps your child’s doctors and/or other vaccine providers keep track of the shots due for your child.
- Helps your doctor send you vaccine reminders for your child.
- Helps to make sure that your child doesn’t miss any shots **OR** get too many shots.
- Allows you to quickly get a copy of your child’s shot record from the doctor.
- **Makes sure your child has all of the vaccines needed to start daycare, school and/or camp, and for international travel.**

What information is in my state’s IIS?
The vaccine records in each state’s IIS is kept confidential, and only authorized users are able to access the information. The exact information stored in the IIS depends on which state (or city) you live in, but most contain:

- Patient’s name (first, middle and last)
- Patient’s birth date
- Patient’s gender
- Patient’s birth state/country
- Mother’s name
- Types of shots given
- Dates the shots were given

Who do I contact to see if my child’s shot record is in my state’s IIS or if I want a copy of my child’s shot record?
- Contact your doctor’s office or other vaccine provider to ask if your child’s shot record is in the IIS and request a copy
- Contact the IIS in your state or in the state where your child got their last shots to see if they have records in the IIS. **To find contact information for your state’s IIS, visit [www.cdc.gov/vaccines/programs/iis/contacts-locate-records.html#state](http://www.cdc.gov/vaccines/programs/iis/contacts-locate-records.html#state).** A few states allow the public to directly access the IIS in order to print out their child’s vaccine records.
HOW TO PAY FOR VACCINES

No one should skip vaccines because of their cost.

Use Vaccinate Your Family’s online tool to help you find out how to pay for your family's vaccines.

1. Enter the person's health insurance status: private insurance, public insurance or no insurance
2. Enter the person's age

Check out the Paying for Vaccines Tool and helpful vaccine information on our website at vaccinateyourfamily.org
Tips for a Less Stressful Shot Visit

Making the choice to vaccinate your child is vital for their health and well-being. Even so, getting shots can still be stressful for you and your little one. Fortunately, there are simple ways you can support your child before, during, and after shots.

Before Getting Shots
Come prepared! Take these steps before your child gets a shot to help make the immunization visit less stressful on you both.

- Read any vaccine materials you received from your child’s health care professional and write down any questions you may have.
- Find your child’s personal immunization record and bring it to your appointment. An up-to-date record tells your doctor exactly what shots your child has already received.
- Pack a favorite toy or book, and a blanket that your child uses regularly to comfort your child.

For older children

- Be honest with your child. Explain that shots can pinch or sting, but that it won’t hurt for long.
- Engage other family members, especially older siblings, to support your child.
- Avoid telling scary stories or making threats about shots.

At the Doctor’s Office
If you have questions about immunizations, ask your child’s doctor or nurse. Before you leave the appointment, ask your child’s doctor for advice on using non-aspirin pain reliever and other steps you can take at home to comfort your child.

Try these ideas for making the shots easier on your child.

- Distract and comfort your child by cuddling, singing, or talking softly.
- Smile and make eye contact with your child. Let your child know that everything is ok.
- Comfort your child with a favorite toy or book. A blanket that smells familiar will help your child feel more comfortable.
- Hold your child firmly on your lap, whenever possible.

Help children see vaccines as a good thing. Never threaten your child with shots, by saying, “If you misbehave I will have the nurse give you a shot.” Instead, remind children that vaccines can keep them healthy.

Ways to soothe your baby:
- Swaddling
- Skin-to-skin contact
- Offering a sweet beverage, like juice (when the child is older than 6 months)
- Breastfeeding

Your health care professional may cool or numb the injection site to reduce the pain associated with your child’s shots.

The Centers for Disease Control and Prevention (CDC), the American Academy of Family Physicians (AAFP), and the American Academy of Pediatrics (AAP) adapted this information from Be There for Your Child during Shots, California Department of Public Health Immunization Branch.
For older children

- Take deep breaths with your child to help “blow out” the pain.
- Point out interesting things in the room to help create distractions.
- Tell or read stories.
- Support your child if he or she cries. Never scold a child for not “being brave.”

Once your child has received all of the shots, be especially supportive. Hold, cuddle, and, for infants, breastfeed or offer a bottle. A soothing voice, combined with praise and hugs will help reassure your child that everything is ok.

After the Shots

Sometimes children experience mild reactions from vaccines, such as pain at the injection site, a rash or a fever. These reactions are normal and will soon go away. The following tips will help you identify and minimize mild side effects.

- Review any information your doctor gives you about the shots, especially the Vaccine Information Statements or other sheets that outline which side effects might be expected.
- Use a cool, wet cloth to reduce redness, soreness, and swelling in the place where the shot was given.
- Reduce any fever with a cool sponge bath. If your doctor approves, give non-aspirin pain reliever.
- Give your child lots of liquid. It’s normal for some children to eat less during the 24 hours after getting vaccines.
- Pay extra attention to your child for a few days. If you see something that concerns you, call your doctor.
